

3D Modeling

Vertices, edges, and faces are the basic components of polygons. When you model with polygons you usually use three-sided polygons called triangles or four-sided polygons called quadrilaterals (quads). Maya also supports the creation of polygons with more than four sides (n-gons) but they are not as commonly used for modeling.

3D Modeling

edges

Bordered Edges

Normals

Normals are imaginary lines perpendicular to each point on a curve or surface (NURBs), or to the surface of a polygon (Polygon)

In Maya, normals are used to determine the orientation of a polygon face (face normals), or how the edges of faces will visually appear in relation to each other when shaded (vertex normals).

Face normal

Normals

Vertex normals

You can modify the shading of individual polygons by manually editing the vertex normals associated with the polygon mesh.

Since they are always perpendicular to the curve or surface, the way normal lines point toward or away from each other can reveal subtle curvature.

Creating polygons

- Using primitives (Create / Polygon Primitives)
- Creating Polygon from scratch (Mesh Tools / Create Polygon Tool)

Smoothing polygons

Creating polygons

Editing in component mode

- Transform vertices, edges, and faces
- Extrude faces or edges (Edit Mesh / Extrude)
- Split faces using snap (Mesh Tools / Multi-Cut)
- Combine or separate meshes
- Merge vertices, edges, and faces
- Delete vertices, edges, and faces
- Append the deleted faces (Mesh Tools / Append to Polygon)

3D modeling

Real-time vs recorded

Real-time: rendering for interactive media, such as games and simulations, is calculated and displayed immediately. It uses the viewer's PC processor and graphics card to produce individual frames of animation as they are displayed.

Non real-time (offline rendering): animations for non-interactive media, such as feature films and video, are rendered much more slowly and presented as video files. Non-real time rendering enables the leveraging of limited processing power in order to obtain higher image quality.

3D modeling

Navigating display windows

View panel change (Space Bar or check the left area layout) : Single View vs. Four View

Perspective View + Orthographic View

Tumble, Track, Dolly Tool (Alt (option) + Mouse Button (left, middle, right button))

Hierarchy

View panel

Check out objects in the scene. Each modeling object is consisted with transform and shape nodes. You can control their hierarchical relations in these windows:

Outliner window

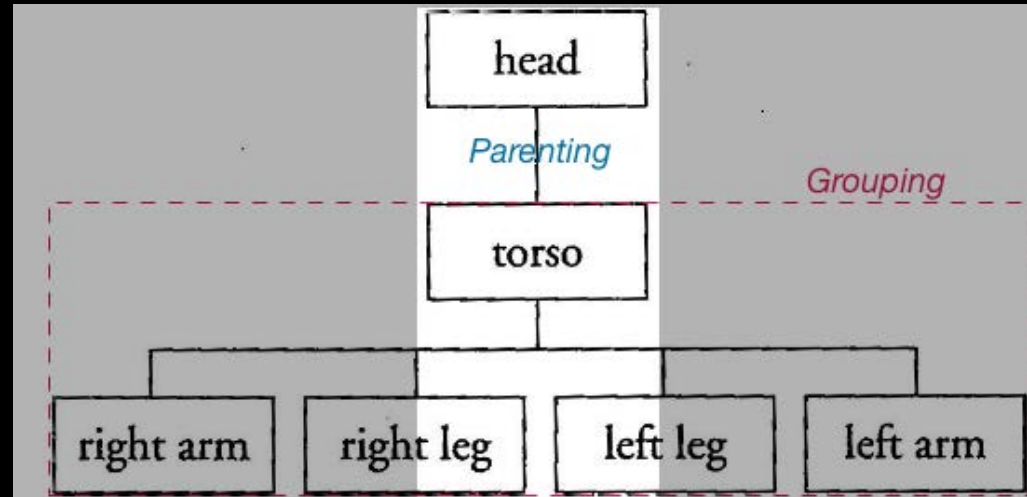

Hypergraph window

Hierarchy

Group vs. parent

Toggle on [Outliner/Display/Shapes] to show shape node along with transform node.

It is important to understand the relations between a transform node and its manipulator's position as a pivot point, when you move, rotate, and scale an object.

Hierarchy

Move the pivot point

Changing the *pivot*, which is a center of manipulator
insert key, or *fn* + *left* arrow key, or *d* key

Virtual Kizhi

KIZHI ISLAND

Kizhi is located on an island in Lake Onega in northern Karelia in Russia.

It is an outdoor museum of fascinating edifices of northern wooden architecture. Kizhi museum preserves a concentration of masterpieces of the Russian heritage and protected by World Heritage List of UNESCO.

KIZHI ARCHITECTURE

Kizhi buildings are unique in that all joints and structural elements were made entirely from wood without the use of any metal nails or ties.

All structures were made of scribe-fitted horizontal logs, with interlocking corner joinery, cut by axes.

KIZHI ARCHITECTURE

The Kizhi ensemble consists of

Church of the Transfiguration
1714, summer church

Church of the Intercession
1764 winter church

Belfry 1874

KIZHI ACCESS

Word “kizhi” is translated from Karelian as “a place for games.”

In ancient times people gathered here and performed their religious rituals.

A remote location, travel distance, limited building access due to restoration efforts make the Kizhi site difficult to visit. The museum is inaccessible during fall through spring months. During the summer the island is accessible by boats only.

Church structures and their textures continue to deteriorate.

The churches remain functional and served the parish until 1937 when the Church of the Transfiguration was officially closed and last priest was shot.
